

Task-4(JS Basics)

Console Window Todo

Your Website will be just controlled from the prompt window and changes can only be noticed in console window.(We have attached couple of images for you reference)

The sample Website url is <https://github.com/GovindCodes/ConsoleTodo>

Website should have three options:

- "new" - To add a Todo
- "list" -To List all Todos
- "quit" - To Quit App and prompt window
- Any invalid input should be handled properly.

You will not be doing this in future this way but this will brushup the use basic logic building with Javascript. Couple of things you will use here are:

- Using prompt and console
- While and for loop in Js
- Arrays and its push method in Js

You have to deploy the Website with netlify or Github pages, and share the url.
